Series TPHA transmitters are designed for applications in high-pressure hydraulic circuits.

It uses the extensimetric measurement principle with photoengraved metal leaf.

The 4 active elements configuration allows significant signals, with conditions of stress with high coefficient of safety on the measurement diaphragm.

Careful selection and ultrasonic checking of materials used guarantee the absence of inclusions and defects on the primary reaction mechanics, assuring a highly reliable product.

The resonance frequency of the measurement diaphragm varies from 18 to 80KHz based on the Full Scale.

The selection of highly stable electronic components and the availability of output signals in voltage and current make series TPHA transmitters suitable for applications in which the signal has to be transmitted over long distances or in smart control and checking systems.
